MindSync site: refinement pass 2

Read this ENTIRE file before doing anything. Then work phase by phase.

You are making a second refinement pass on the MindSync marketing site (single-page, EEG decision-support startup, visitors mostly arrive by QR scan on a PHONE at a tech summit). Inspect the repo first and follow its existing conventions, tokens and component patterns.

Hard constraints

- There is NO demo video and NO finished product. The only real asset is a prototype design RENDER of the headset. Never imply a working device, real recordings, clinical results or a live demo.
- Keep every simulated/illustrative visual labelled ("Illustrative simulation", "Design render").
- Do not invent copy claims, metrics, logos, photos or testimonials.
- Do not weaken or remove the safety/regulatory wording; you may only de-duplicate it.
- Keep the existing palette and serif-heading / sans-body pairing.
- Do not change any price numbers. If something about the numbers looks inconsistent, flag it to me instead of editing.

FILL IN (decided by me, the founder)

STATUS_LABEL_FOR_HARDWARE = "<e.g. Design stage / Bench prototype / Current>"

Use this exact label for the hardware status chip everywhere it appears (hero chip, the EEG headset card in the pipeline row, and the first card in "Where we are today"). Also adjust the neighbouring text ("Four-channel proof of concept", "4-channel EEG R&D prototype") so it never says more than that label supports. If STATUS_LABEL_FOR_HARDWARE is still the placeholder above, STOP and ask me before touching any status chip.

Process

Work in phases. After each phase, summarize what changed and wait for my "continue". Do not start the next phase early.

Phase 1: Status accuracy and hero

- Apply STATUS_LABEL_FOR_HARDWARE as described. Keep "Current" only on items that are genuinely real; do not use it for anything that exists only as a design.

- Hero layout: make the headset render noticeably larger (roughly 45% of the hero width on desktop, full width below the CTAs on mobile). Remove the light boxed card around it if it can sit on the navy background cleanly (soft shadow or subtle tinted container is fine); keep the "Design render" badge.
- Widen the headline column so the headline wraps in at most 3 lines on desktop, and reduce headline size slightly on mobile if needed.
- Hero copy: it is currently over-hedged ("Exploring...", "Researching how... might support..."). Propose TWO alternative headline+subline pairs that state what we are building in active voice (a wearable EEG and AI workflow that organizes signals for therapist review), while the status chip and the "Research prototype. Not a diagnostic tool." line carry the caution. Show me both options as text and wait for my pick before changing copy.
- Keep the hero fitting headline + render + CTA in a 375x667 viewport.

Phase 2: Unify the demo and the pipeline

- The waveform demo has 4 tabs (Capture/Process/Estimate/Summarize) but the pipeline below has 6 stages. Make them one system: clicking or auto- advancing a stage should highlight the matching pipeline card, and the caption should no longer talk about two separate sets of stages. Prefer the six pipeline cards as the controls (stages without a distinct visual can reuse the nearest panel state) rather than adding more tabs.
- Make the four waveform channels look less identical: different amplitude, frequency and a little noise per channel. Keep it calm and clearly labelled as simulated. Respect prefers-reduced-motion (static frame if reduced).
- Keep the Delta/Theta/Alpha/Beta bars; make their labels at least 12-13px.

Phase 3: Cleanup

- Team cards: remove the visible "Photo slot" text. Keep the avatar circle; leave a code-level slot/prop where a photo can be dropped in later.
- About + Problem: replace the two small left-aligned columns under the centered heading with a single centered paragraph (max ~60 characters wide lines) so alignment is consistent.
- Pricing: remove the "Planned" chip from the third (future, not available) card since its eyebrow already says so; keep chips elsewhere only if they add meaning. Merge the two disclaimers (subtitle and footnote) into one. Flag to me, without changing it, that the consumer headset price equals the clinic package price even though the package includes training and a year of software.
- Roadmap: check for stray italic spans mid-sentence and make styling consistent.
- Footer: make the tagline non-italic and readable (or remove it); do not invent a new tagline.

Phase 4: Mobile, contrast, type

- Mobile nav as a hamburger/sheet with "Talk to us" always visible; the six-stage pipeline as a vertical stepper; all card grids single column.

- Tappable elements at least 44px tall.
- WCAG AA contrast for body-size text: check small gold text (eyebrows, roadmap dates), grey card copy, the dashed card's small print and the footer text; use a darker gold for text and keep the brighter gold for fills and borders.
- Body text 16px minimum; captions and footnotes 13-14px minimum.
- Add or verify alt text on both renders and the waveform simulation.

At the end

List what I should verify on a real phone and anything you were unsure about instead of guessing.
